

# Nərimanov SmartOps

City Operations Platform

A unified digital operations platform for Narimanov District, Baku — connecting citizens, field inspectors, and executive leadership through a single intelligent system for reporting, task dispatch, analytics, and real-time oversight.

### 01 — BRAND OVERVIEW

## What is Nərimanov SmartOps?

Nərimanov SmartOps is a next-generation city operations platform purpose-built for the Narimanov District Administration in Baku, Azerbaijan. It digitizes the complete lifecycle of a citizen problem report — from the moment a pothole is photographed to the moment it is officially resolved and archived — replacing fragmented phone calls, paper forms, and siloed Excel sheets with a single, role-aware digital system.

The platform is built around three deeply distinct user roles that interact with the same underlying data but through completely different interfaces, each designed around the real daily workflows of that role.

### **Vətəndaş (Citizen)**

Residents of Narimanov District who need to report infrastructure problems, submit improvement proposals, and receive official government announcements. The citizen interface is mobile-first, conversational, and requires zero technical knowledge.

### **Müfəttiş (Inspector)**

Field engineers and municipal workers who are dispatched to locations to physically fix reported issues. They need daily task lists, GPS-routed maps, photo proof uploads, and a digital twin simulation tool to assess risk before digging.

### **İcraçı (Executive)**

District leadership, department heads, and compliance officers who need a macro view of all operations — SLA performance, agency-level KPIs, trend analytics, inter-agency coordination tracking, and the ability to issue public alerts.

---

## **BRAND IDENTITY**

### **Visual Language**

The product uses a clean, modern government aesthetic — authoritative enough to feel official, but friendly enough for citizens with no digital literacy. The visual system is built on four principles:

#### PRIMARY COLOR

**#1A3C6E** — Deep navy. Used for all primary CTAs, headings, navigation active states, and the brand logo initials "NS". Communicates trust, governance, and stability.

#### ACCENT / EXECUTIVE

**#7C3AED** — Violet purple. Used exclusively in the Executive portal to distinguish it visually from citizen (blue) and inspector (green) contexts.

#### INSPECTOR / SUCCESS

**#059669** — Emerald green. Represents field operations, task completion, and resolved states. Used in inspector portal accents.

#### STATUS COLORS

**Amber** = Pending/Warning · **Blue** = In Progress · **Green** = Resolved · **Red** = Overdue/Critical

#### USER FLOW

### End-to-End Journey

Every interaction in the platform is connected. A citizen report triggers a chain reaction across all three portals:

Live  
Monitoring

# The Front Door

The landing page at `nərimanovsmartops.az /` is a public-facing marketing page that introduces the platform and directs users to the authentication flow. It is not a dashboard — it is a credibility-building entry point designed to communicate the value of the system before anyone logs in.

# Landing Page

Public

Route: / · Public, no auth required

The landing page is split into two primary sections visible above the fold on desktop:

- **Left Column — Hero & Feature Grid**

Large headline "Nərimanov SmartOps" with the district tagline. Three KPI pills (24/7 monitoring, +32% SLA compliance, 15 agencies). Below that, a 2×2 feature card grid explaining AI Classification, Route Maps, Digital Archive, and Simulation tools.

- **Right Column — Portal Selector Card**

A white card titled "Portal seçin" (Choose portal) showing three clickable role cards: Citizen (Vətəndaş), Inspector (Müfəttiş), Executive (İcraçı). Each card shows a role icon, title, and one-line description. Clicking any card navigates to /auth.

- **Live Status Panel**

A card showing real-time city metrics: open requests (48), in-progress (19), overdue (6), new alerts (3). Plus an SLA compliance progress bar at 86%.

- **Service Lines Grid**

Four colored service category cards: Electricity (12 tasks), Water (9), Roads (7), Sanitation (5). Each shows the active task count for visual urgency.

- **Recent Activity Feed**

Three inter-agency transaction cards showing real-time coordination between agencies (e.g. Azərqaz → Yollar Dövlət Agentliyi: post-excavation restoration request, 14 days SLA). Each card shows sending agency, receiving agency, task title, and status badge.

- **Workflow Steps**

A 3-step horizontal flow diagram: (1) Qəbul — report received, (2) İcra — task dispatched to agency, (3) Nəticə — SLA report completed. Each step numbered and styled as a rounded card.

### **Design Intent**

The landing page builds trust before login. A skeptical citizen or a government auditor can see the platform's scope, live numbers, and agency workflow without needing credentials. This reduces the "what is this?" barrier and drives portal adoption.

### 03 — AUTHENTICATION

# Login & Registration

All three user roles — citizen, inspector, and executive — authenticate through a single unified auth page. The system uses email and password for all users. The backend determines which portal to redirect the user to based on the `role` field returned by the API.

# Auth Page

Public

Route: /auth · Public, no auth required

A centered, minimal card layout. White card on a light gray background. The card contains a tab switcher between Login and Register.

## **G Giriş (Login Tab)**

Two fields: Email address and Password. Password field includes a show/hide eye toggle. A large "Daxil ol" (Sign in) primary button spans the full width. Client-side validation shows error messages in Azerbaijani (e.g. "Email düzgün deyil", "Şifrə ən az 6 simvol"). On successful login, the user is immediately redirected to their role-specific portal — no manual portal selection needed.

## **Q Qeydiyyat (Register Tab)**

Three fields: Full Name (Ad Soyad), Email, and Password. Same show/hide toggle on password. "Qeydiyyatdan keç" (Register) button. The API call returns a token and role exactly like login — registration immediately signs the user in. No email verification step is shown in the current UI (can be added server-side).

- **Brand Header**

Above the auth card: the "NS" brand monogram in a navy square, the product name "Nərimanov SmartOps", and the subtitle "Şəhər idarəetmə platforması".

- **Role Routing (Automatic)**

citizen → /citizen · inspector → /inspector · executive → /executive. The user never sees a dropdown or portal chooser after auth.

- **Token Storage**

On success: token saved to `localStorage["apexcore_token"]`, role to `localStorage["apexcore_role"]`, user object to `localStorage["apexcore_user"]`. The axios client automatically attaches the Bearer token to every subsequent API call.

- **Error Handling**

Toast notifications via Sonner library. Invalid credentials show the API error message. On 401 anywhere in the app, the client clears `localStorage` and redirects back to /.

# Vətəndaş Portalı

The Citizen Portal is the most public-facing part of the product. It is designed for everyday residents of Narimanov who may have limited digital literacy. The UX is deliberately simple — a single scrollable page with a sticky tab navigation at the top. No sidebars, no dashboards, no complexity.

## Mobile-First Design

The citizen portal is constrained to max-width: 768px and centered. It is explicitly optimized for phone screens, even though it also renders on desktop. All cards are large, touch-friendly, and use bottom-heavy spacing for thumb reach.

## Citizen Portal — Header

Citizen

Route: /citizen · Auth required, role: citizen

A sticky top header (PortalHeader component) showing: "Vətəndaş Portalı" role label on the left, notification bell with a red badge (count = active alerts), and the user's name "Əli Məmmədov". Immediately below the header is a sticky tab bar with 4 tabs.

## 1 Müraciətlərim (My Reports)

The default landing tab when a citizen opens the portal. Shows all reports they have submitted and allows creating new ones.

- ✓ **New Report Button:** A large blue CTA "Yeni müraciət" at the top. Clicking opens a modal form with fields for: Title, Detailed Description (textarea), Address, District/Neighborhood, Category (dropdown: Roads / Water / Electric / Landscaping / Waste / Other), and a Map picker (Google Maps integration to drop a pin).
- ✓ **KPI Summary Row:** Three colored stat boxes — Pending (amber), In Progress (blue), Resolved (green) — showing the citizen's personal report counts at a glance.
- ✓ **Report Cards:** Each report shows: Report ID (e.g. MR-0241), title, address with map pin icon, AI-routed agency (e.g. "Azərişiq ASC"), submission date, and a status badge.
- ✓ **Status Badges:** Four states — Gözləyir (Pending, amber), İcrada (In Progress, blue), Həll olundu (Resolved, green), Gecikib (Overdue, red).

## 2 Təkliflərim (My Proposals)

Citizens can submit improvement ideas for the district — a bike lane, smart pedestrian crossings, free WiFi zones. Other citizens can view and vote on these proposals.

- ✓ **New Proposal Button:** A dashed-border button "Yeni təklif yaz" at the top. Opens a modal with: Title, Description textarea, Category tag (dropdown: Infrastructure / Environment / Transport / Education / Social / Technology).
- ✓ **Proposal Cards:** Each card shows title, category tag pill, description, author name, date, and vote count.
- ✓ **No voting in this tab:** Voting is available in the Inspector portal's Proposals tab (inspector can vote on behalf of field observations). The citizen view is read/submit only.

## 3 Bildirişlər (Government Alerts)

Official announcements pushed by the Executive to all citizens. Read-only for citizens.

- ✓ **Alert Types:** Warning (amber triangle icon — planned disruptions like water cuts), Success (green check — work completions), Info (blue info — planned events or road works). Each type has a distinct colored card background.
- ✓ **Alert Card Details:** Icon + Title + Body text + District name + Date/Time. Example: "Planlı su kəsintisi — 28 May" — water outage from 09:00–17:00 in specific buildings.

#### 4 Şəkillər (Images) — Optional

A personal photo gallery section. Entirely optional — has no required state and no validation. Citizens can upload photos from their device to attach visual evidence to any report or proposal, or simply keep a visual record.

- ✓ **Drop Zone:** A large dashed-border drop area with an upload cloud icon. Supports drag-and-drop or click-to-browse. Accepts JPG, PNG, WEBP. Multi-file select supported.
- ✓ **Gallery Grid:** Uploaded photos appear in a 2-column (mobile) or 3-column (desktop) responsive grid. Each cell is square, filled with object-cover scaling.
- ✓ **Hover Actions:** On hover, each photo shows two action buttons: Zoom (opens fullscreen lightbox) and Delete (removes from gallery, revokes object URL).
- ✓ **Lightbox:** Clicking zoom opens a full-screen dark overlay with the image centered. ESC or X button closes it.
- ✓ **Metadata Overlay:** Each photo card shows filename and upload date as a gradient overlay at the bottom.

# Müfəttiş Portalı

The Inspector Portal is built for municipal field workers and engineers. Unlike the citizen portal (which is reactive — citizens respond to problems), the inspector portal is operational — it drives the inspector's entire workday from morning briefing to task completion and documentation.

## Field-First Design

The portal is designed for someone who checks their phone before getting into their van at 8am. The default tab is the Route Map — not a text list. The priority system uses colored dots (red = critical, amber = medium, green = low) visible at a glance without reading.

## 1 Gündalik Marşrut (Daily Route Map)

The default tab. Shows the inspector's complete workday at a glance: a map with all task pins, then a numbered list of today's tasks.

- ✓ **Task Map (TaskMap component):** An interactive map showing all assigned task locations as numbered pins. High-priority tasks use a red pin, medium amber, low green. Each pin is clickable. A summary bar at the top shows total tasks / in-progress / completed counts.
- ✓ **Today's Tasks List:** Numbered cards (1, 2, 3...) for each active task below the map. Each card shows the task number circle (color = priority), title, address with map pin icon, and status badge. Clicking "Tapşırıqlar" on the map navigates to the full Tasks tab.

## 2 Tapşırıqlar Paneli (Tasks Panel)

Full accordion-style task list. Each task can be expanded to reveal details and action buttons.

- ✓ **Task Card (Collapsed):** Priority dot + Task title + Address + Status badge + Expand chevron. Collapsed by default to show the full list quickly.
- ✓ **Task Card (Expanded):** Category and date metadata boxes, Agency (Qurum) name, full description text, and Agency Requirements list (e.g. "Excavation permit", "Water shutdown notice", "Photo report before/after").
- ✓ **Start Button:** "► Başla" (Start) — changes status from Pending → In Progress.
- ✓ **Complete Button:** "✓ Tamamla" — changes status from In Progress → Resolved.
- ✓ **Proof Upload:** "Sübut yüklə" file picker button — uploads an image as proof of completion to the backend. File input hidden behind a styled label for clean UX.

### 3 Simulyasiya Paneli (Digital Twin Simulation)

The most technically unique screen in the product. Inspectors can run a pre-work digital twin simulation to assess environmental and infrastructure risk before starting physical work at a location. Think of it as a pre-flight checklist for field operations.

- ✓ **Header Card:** Dark navy gradient card titled "Rəqəmsal Əkiz Simulyasiyası" (Digital Twin Simulation) with a Layers icon. Explains the purpose.
- ✓ **5 Risk Layer Toggles:** Yeraltı Sular (Underground Water / +20pts), Şəhər Tıxacı (Traffic / +25pts), Külək Axını (Wind Flow / +15pts), Səs-küy Çirklənməsi (Noise Pollution / +20pts), Qruntun Davamlılığı (Ground Stability / +20pts). Each has a smooth iOS-style toggle switch.
- ✓ **Impact Score Bar:** As layers are toggled, a live progress bar fills from 0 to 100. Color changes from blue → amber → red as score increases. Above 60 points shows a red warning banner "Yüksək risk — müdaxilə tövsiyə olunur".
- ✓ **Run Simulation Button:** "▶ Simulyasiyanı Başlat" — sends the selected layers to the backend API. Shows a loading state, then a success toast with the final impact score.

### 4 Təkliflər (Community Proposals)

Inspectors have field-level insight that citizens don't. This tab lets inspectors review and vote on citizen improvement proposals — they've seen the road, the park, the drainage — their vote carries informed authority.

- ✓ **Proposal Cards (ProposalCard component):** Title, description, author, date, category tag, and vote count with a thumbs-up button. Voted proposals show filled icon.
- ✓ **Sorted by votes:** Most popular proposals surface to the top, helping the executive team prioritize community investment.

# İcraçı Portalı

The Executive Portal is the command center for district leadership. Unlike the other portals (which are task-level), this portal operates at the organizational level — it is about patterns, not individual tasks. It answers questions like: "Which agency is underperforming?", "Are SLAs being met?", "What is the trend in unresolved reports?", "Is there a cross-agency coordination bottleneck?"

### Wide-Screen First

The Executive portal uses max-width: 1152px — significantly wider than the other portals. Charts, tables, and grid layouts use the full screen width. Designed for use on desktop monitors in offices, not mobile phones.

## KPI Summary Row

Executive

Always visible above the tab navigation

Four large KPI cards displayed in a 4-column grid at the very top of the page, before any tabs. These numbers are always visible regardless of which tab is active.

10

Total Reports

4

Resolved

6

Open

3

SLA Breaches

### 1 Analitik Panel (Analytics Dashboard)

Five charts and tables in a responsive 2-column grid. All powered by Recharts library with real API data (fallback to mock data if API unavailable).

### 2 Raporlar Arxiv (Digital Archive)

A full searchable, filterable table of every report in the system. The executive's auditing tool.

### 3 Qurumlara Nəzarət (Agency Oversight)

The most complex and visually rich tab. Tracks inter-agency coordination requests — when one agency (e.g. Azərqaz) finishes their work and needs another agency (Yollar/Roads) to come restore what they damaged.

- ✓ **Hero Banner:** A gradient card (white → purple → amber) showing the tab title, description, and 4 mini-KPIs: Total requests / Active / Overdue / Average SLA days.
- ✓ **Search + Filter Bar:** Searches across title, agency names, and location. Same status filter pills as Archive tab but using purple styling.
- ✓ **Request Cards (2-col grid):** Each card shows: Request ID (QR-XXXX), title, location, sending agency pill, receiving agency pill, deadline date, SLA days box (green if on-track, red if overdue), optional note text, and status badge.

### 4 Xəbərdarlıqlar (Alerts Management)

The executive can publish official government announcements and manage existing ones. This is the only place in the product where content is created by an executive and consumed by citizens.

- ✓ **"Yeni bildiriş" Button:** Opens a modal form with: Title, Body text (textarea), Type (dropdown: Məlumat/Info, Xəbərdarlıq/Warning, Müsbət/Success), District field. Submitting calls POST /alerts and refreshes the list.
- ✓ **Alert Cards with Delete:** Same card design as the citizen alerts view but with a trash icon button on the right. Clicking it calls DELETE /alerts/{id}.
- ✓ **Live Count Badge:** The Alerts tab shows a red numeric badge with the current alert count. This is the same count shown on the notification bell in the header.

# Under the Hood

The platform is a modern single-page application with a clean separation between the frontend UI layer and the backend API. The frontend is fully functional with mock data fallback — meaning demos and prototypes work even without a live server.

## Technology Stack

---

## Shared UI Component Library

The product uses a small, consistent internal component library. All portals use the same components — only colors and sizing differ between roles.

- **Button**

4 variants: primary (navy fill), secondary (white + navy border), danger (red), ghost (transparent). 3 sizes: sm, md, lg. Accepts a loading prop that shows a spinner and disables interaction.

- **Input**

Labeled text input with error state. Error string turns border red and shows helper text below. Accepts all standard HTML input attributes. Built with forwardRef for form libraries.

- **Modal**

Slide-up overlay with backdrop. Title, scrollable body, and footer slot for action buttons. Closes on backdrop click and ESC. Used for New Report, New Proposal, New Alert, SLA Report forms.

- **Spinner**

3 sizes (sm/md/lg). Used inside Button during loading, and as full-section loading placeholders.

- **PortalHeader**

Shared sticky header across all three portals. Takes role, userName, and notifCount props. Renders a role label, notification bell badge, and user name. Styled differently by role context.

- **LocationPickerMap**

Google Maps embed with clickable pin drop. Used in the New Report modal. Returns lat/lng coordinates that are sent to the API alongside the report text.

---

## Mock Data Fallback

Every API call in the application has a graceful fallback to mock data. If the backend returns an error or empty array, the UI displays realistic placeholder data. This means:

- ✓ Demos work without a live server
- ✓ Frontend development is fully decoupled from backend readiness
- ✓ The product always looks fully populated — no empty states during presentations
